

**IN THE SPECIFICATION**

Please amend the paragraph beginning on page 6, line 22 as follows:

As discussed above, the lead 110 includes the housing 180. In one option the housing is a molded component, with molded features therein. The features that can be molded on or in the housing 180, for example the guide (discussed below), allow for the lead to be made with less expensive components. The molding also allows for repeatable dimension control, including the position of molded inserts, such as a fluoromarker ~~118~~ 117. It further allows for the housing 180 and the lead 110 to be made smaller, resulting in less trauma to the patient. The molding process also allows for a greater selection of materials that can be used for the housing 180.
